

AWS DevOps Engineer Intern Assignment Report

Name: Vatsal Shah

Date: 16 July 2026

Objective

Deploy a simple website on an AWS EC2 Ubuntu instance using Nginx and document the complete process.

AWS Services Used

- Amazon EC2
- Security Groups

EC2 Configuration

Ubuntu EC2 instance launched in AWS. Security Group configured to allow SSH (22) and HTTP (80). Connected using SSH.

Linux Commands Used

```
sudo apt update
sudo apt install nginx -y
sudo systemctl status nginx
sudo systemctl restart nginx
df -h
free -h
ps aux
```

Website Deployment

Created a custom index.html page containing personal details and replaced the default Nginx page. Verified the website using the EC2 Public IP in a web browser.

Git & GitHub

Created a public GitHub repository and uploaded index.html and README.md.

Problems Faced

Configured Security Group correctly for HTTP access, verified Nginx service status, and ensured the website was reachable through the EC2 public IP.

Learnings

Learned EC2 provisioning, SSH connectivity, Linux administration basics, Nginx installation, static website hosting, and Git/GitHub workflow.

Time Taken

Approximately 2–3 hours.

Screenshots

Attach the following screenshots before submission:

1. EC2 Dashboard
2. SSH Login
3. Nginx Status
4. Website in Browser
5. GitHub Repository
